

TransactionVision® Improves on Business Visibility with Digital Dashboards *CORDA's Software Expertise Increases Business Visibility for TransactionVision*

Bristol Technology's TransactionVision product monitors and tracks business transactions from start to finish for organizations in the banking, financial markets, and insurance industries. Bristol knows how important it is for the software its clients use to be sophisticated and powerful, yet, easy to use.

Bristol understands and appreciates the complexities associated with today's business transactions. These insights help to identify the resources companies need to visualize and comprehend what is happening from beginning to end of a business transaction.

Challenge: Turning Data into Decisions

Whether Bristol's clients are involved in supply chain management, securities trading, order fulfillment or payment processing, they need world-class data visualization—dynamic charts and graphs—to quickly and accurately understand their business.

Bristol searched for a solution that would enhance its TransactionVision with a charting and graphing capability that was both fast and flexible. A superb professional appearance was mandatory.

"Visual appearance has a direct impact on a client's perception of our product," said Chane Cullens, Senior Vice President of Technology for Bristol Technology. "We needed to find a way to provide charts and graphs that would maintain a professional image."

Bristol also needed to support a wide variety of platforms, and support sophisticated output formats, including SVG.

To that end, Bristol integrated Corda's software directly into its TransactionVision product. Corda's software turns complex transactional data into visually appealing, real-time charts and graphs that allow managers to make fast, informed decisions.

Solution: Digital Dashboards Powered by Corda

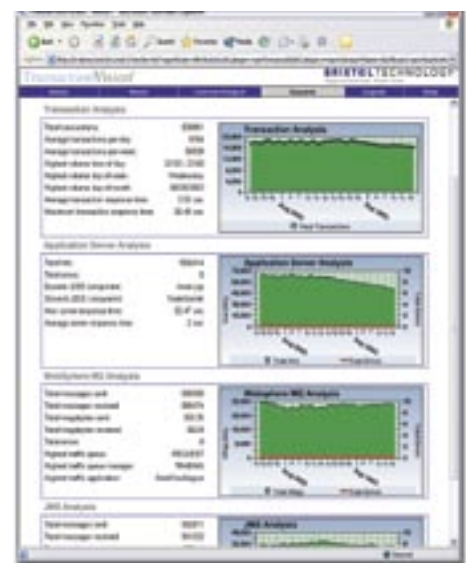

"Our clients are inundated with information. What they want more than anything else is the ability to quickly evaluate reports and control what they look at," Cullens said. "We've found that digital dashboards allow us to deliver the real-time information our clients need in a coherent format that they can actually use effectively. We decided Corda offered the perfect solution."

Digital dashboards present information to decision-makers in the right way, real-time. They provide a simple way for executives and managers to monitor key performance metrics at critical points across the business. They can be customized to meet the specific needs of companies or individuals. A major component of the digital or executive dashboards Bristol has created is the business charts, graphs, gauges, and dials created with Corda's software.

"Corda's software enables us to provide our clients a clearly understandable real-time view of their transactions," said Cullens. "The power and flexibility of the software fits right in with our offerings, and its stellar track record made it an easy choice to integrate its dynamic charting and graphing capabilities directly into TransactionVision."

Transaction Dashboard

Service Level Agreement Analysis

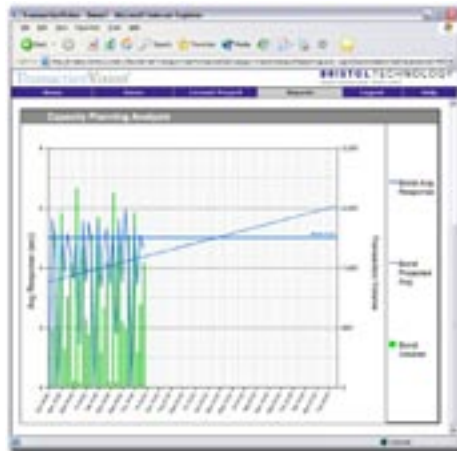

Corda's software allows TransactionVision's business users to see trends and exceptions, and allow them to take action immediately. This allows decision makers to drill down into the vital details of the data to identify what happened, where it happened and when it happened. This empowers managers and executives to make decisions to nip the problems in the bud.

"It's absolutely brilliant the way Corda has designed their software. The first time we saw our dashboard we experienced the WOW factor," stated Cullens.

Achieve all the Benefits without the Pain

TransactionVision is installed without the need to modify applications or middleware. Its advantage is that it can monitor business transactions that cross disparate technology platforms, as well as geographic areas, without adversely impacting the customer's enterprise. All of Corda's software is written in Java, which empowers Bristol to dismiss any worries about compatibility and take advantage of the flexibility offered by cross-architecture, cross-platform computing. Additionally, it provides the ability to pull data from several different sources to populate a dashboard or individual graph.

"TransactionVision allows customers to instantly determine if transactions are executing as expected, how long each step is taking and precisely where the bottlenecks are happening," Cullens said. "Corda's software provides the visual element that allows our clients to turn data into actionable information."
